

Abstract of the Disclosure

An information terminal device includes a wireless local area network (LAN) access section, a search section and a display section. The wireless local area network (LAN) access section accesses a wireless LAN. The search section searches a hot spot in or near a desire place based on a desire place data indicating the desire place. The hot spot is a place where a wireless LAN connection can be established. The desire place is a place where a user desires to access a wireless LAN. The display section displays a hot spot data indicating a place of the hot spot searched by the search section.
